## REPORT:

- In the text box where the identity card (ID) is entered, where only numeric characters are allowed when typing an unsupported character, the alert jumps and eliminates everything previously entered. It is mentioned that "it is a double job" and can become a problem in various situations.
- In the text box where the treatment time is entered, at the beginning there was confusion about the format that should be entered (only numbers or only text), but the conclusion was reached with the client that it is more practical to add text than indicate that measure of time is the number entered previously (min, h, hours), for example: 50 min, 30 minutes, 1 hour.
- In the Client List option, it is necessary to order each registered client by date, since it is easier for the client to see the ordered list.
- The colors of the application interface should be lilac tones instead of turquoise or light blue.
